

Unutarnji Liquidity vs Vanjski Liquidity

by Luka Tatalović

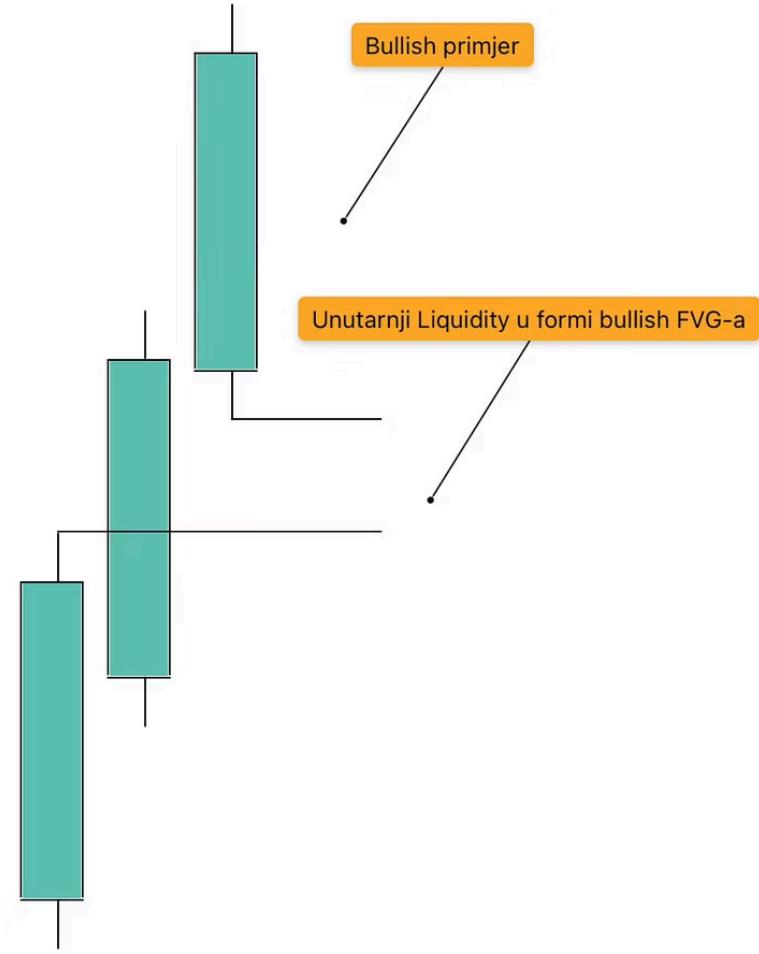

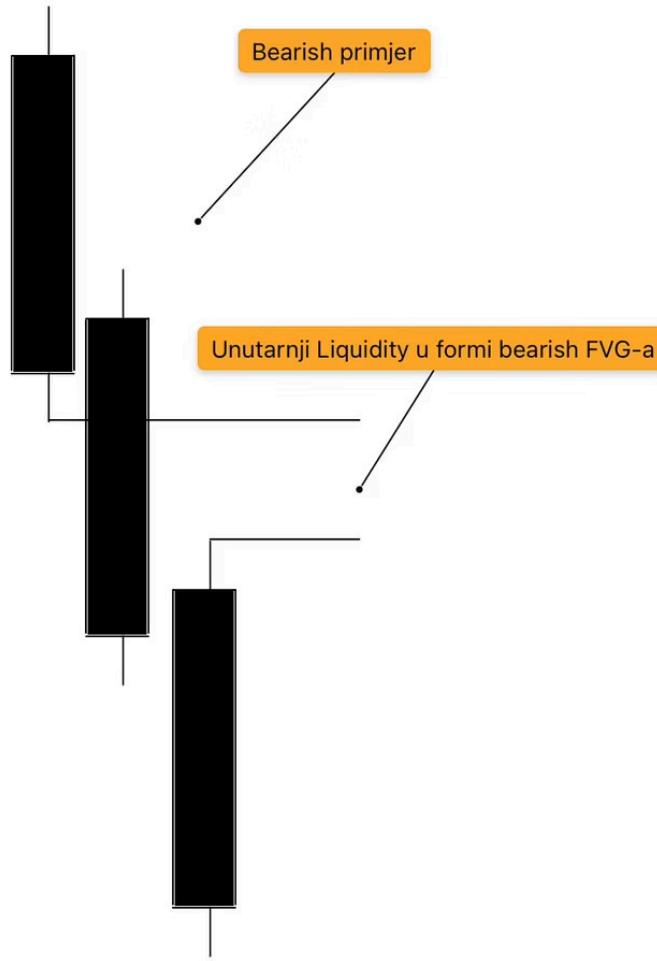

Unutarnji Liquidity odnosi se na likvidnost između nekog swing higha i swing lowa.

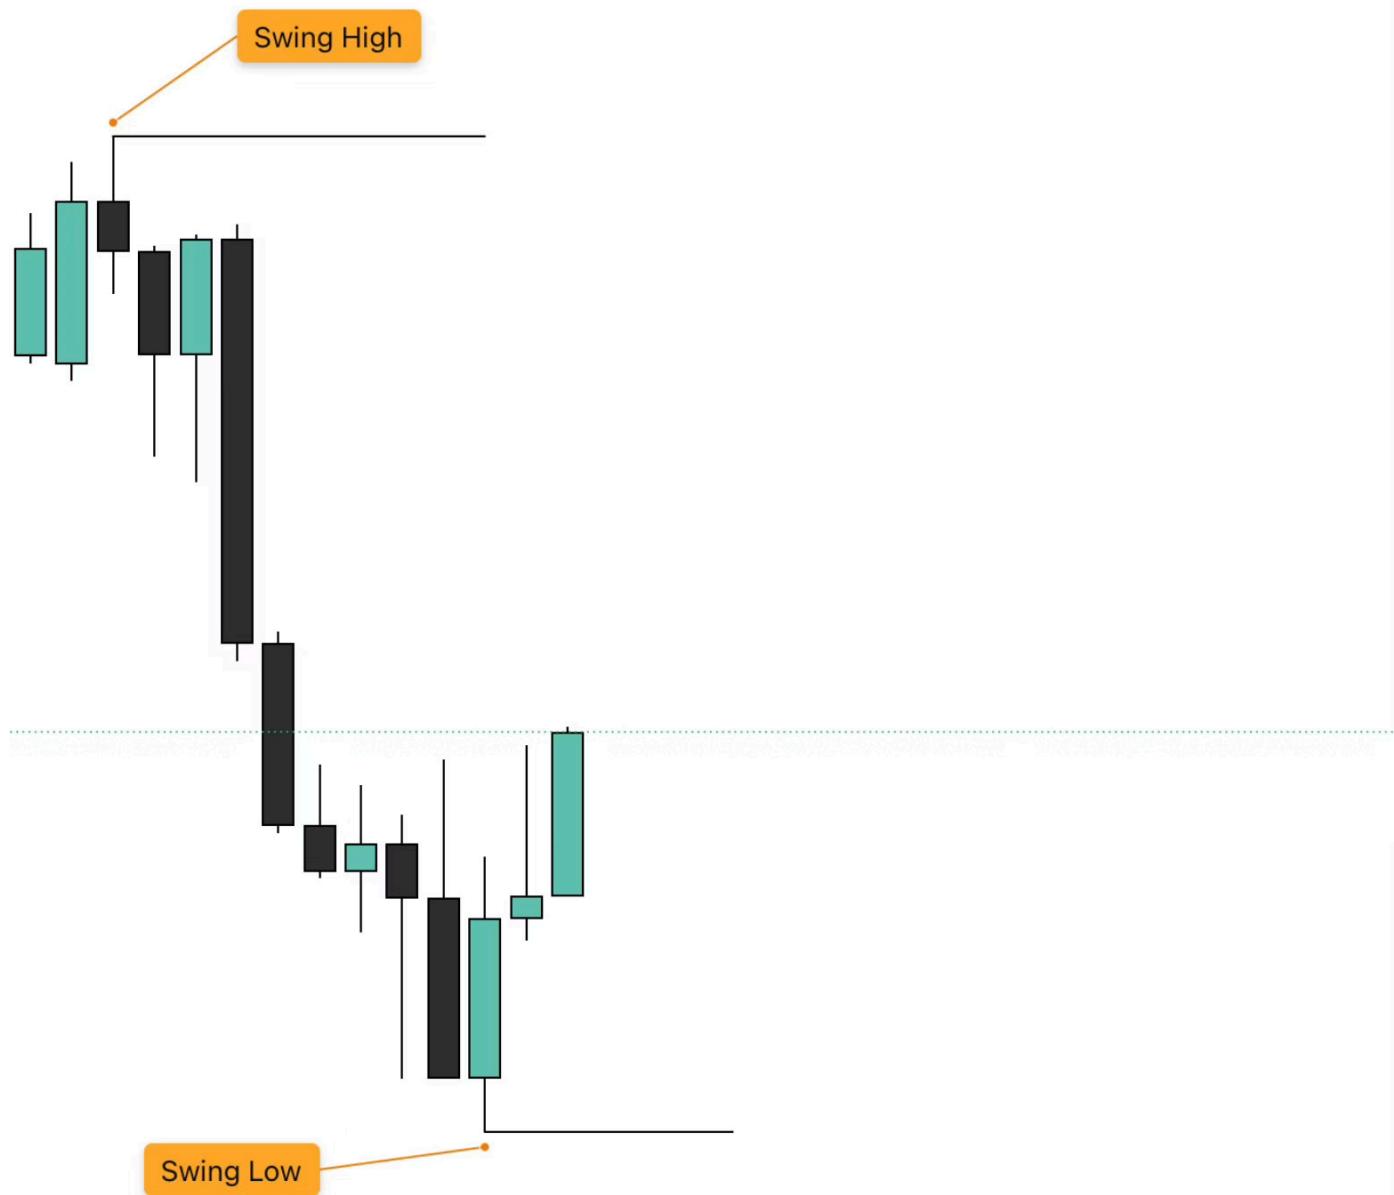

Vanji Liquidity je likvidnost koja se nalazi iznad swing higha i ispod swing lowa obično na većem time frameu.

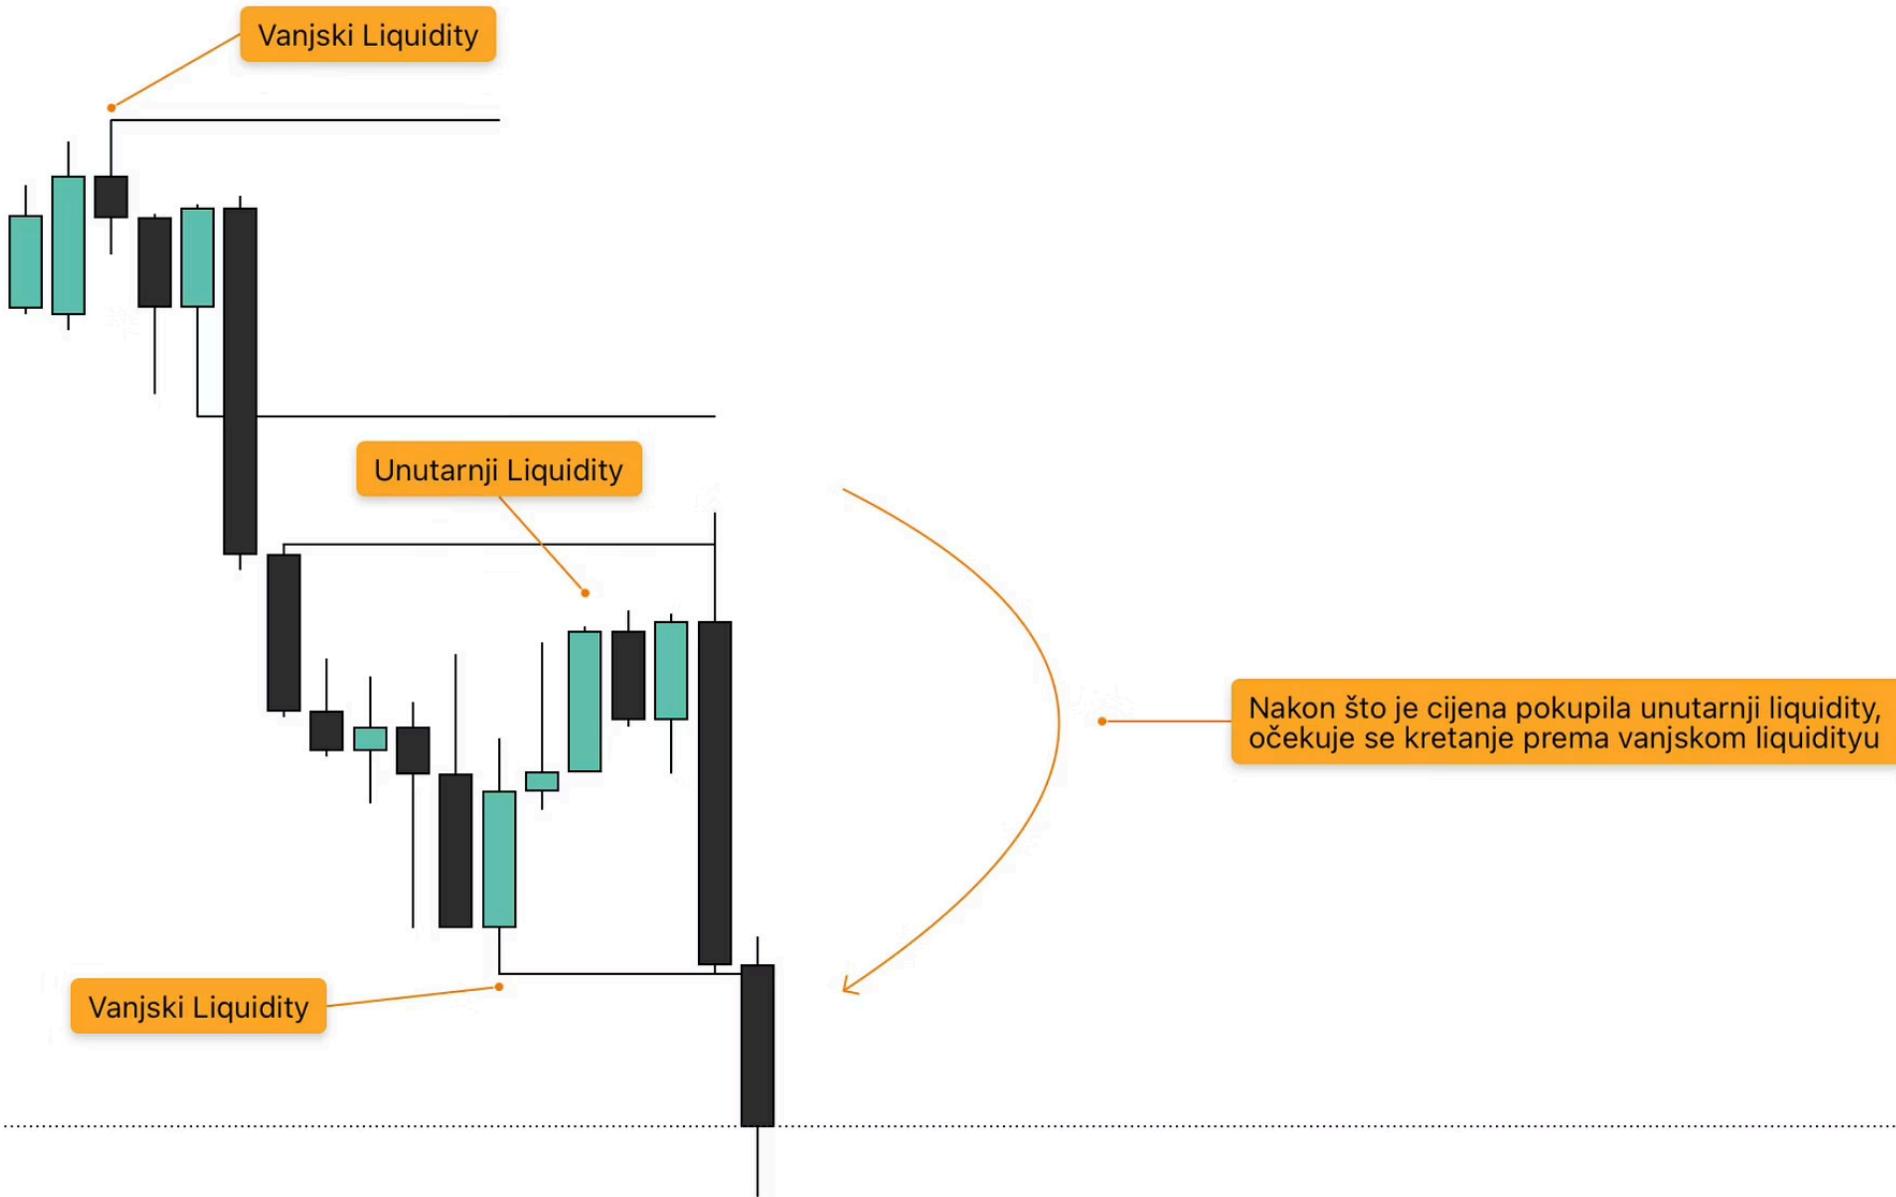

Npr. zamislite da na H1 grafu imamo **FVG** unutar kojeg se cijena trenutno kreće.

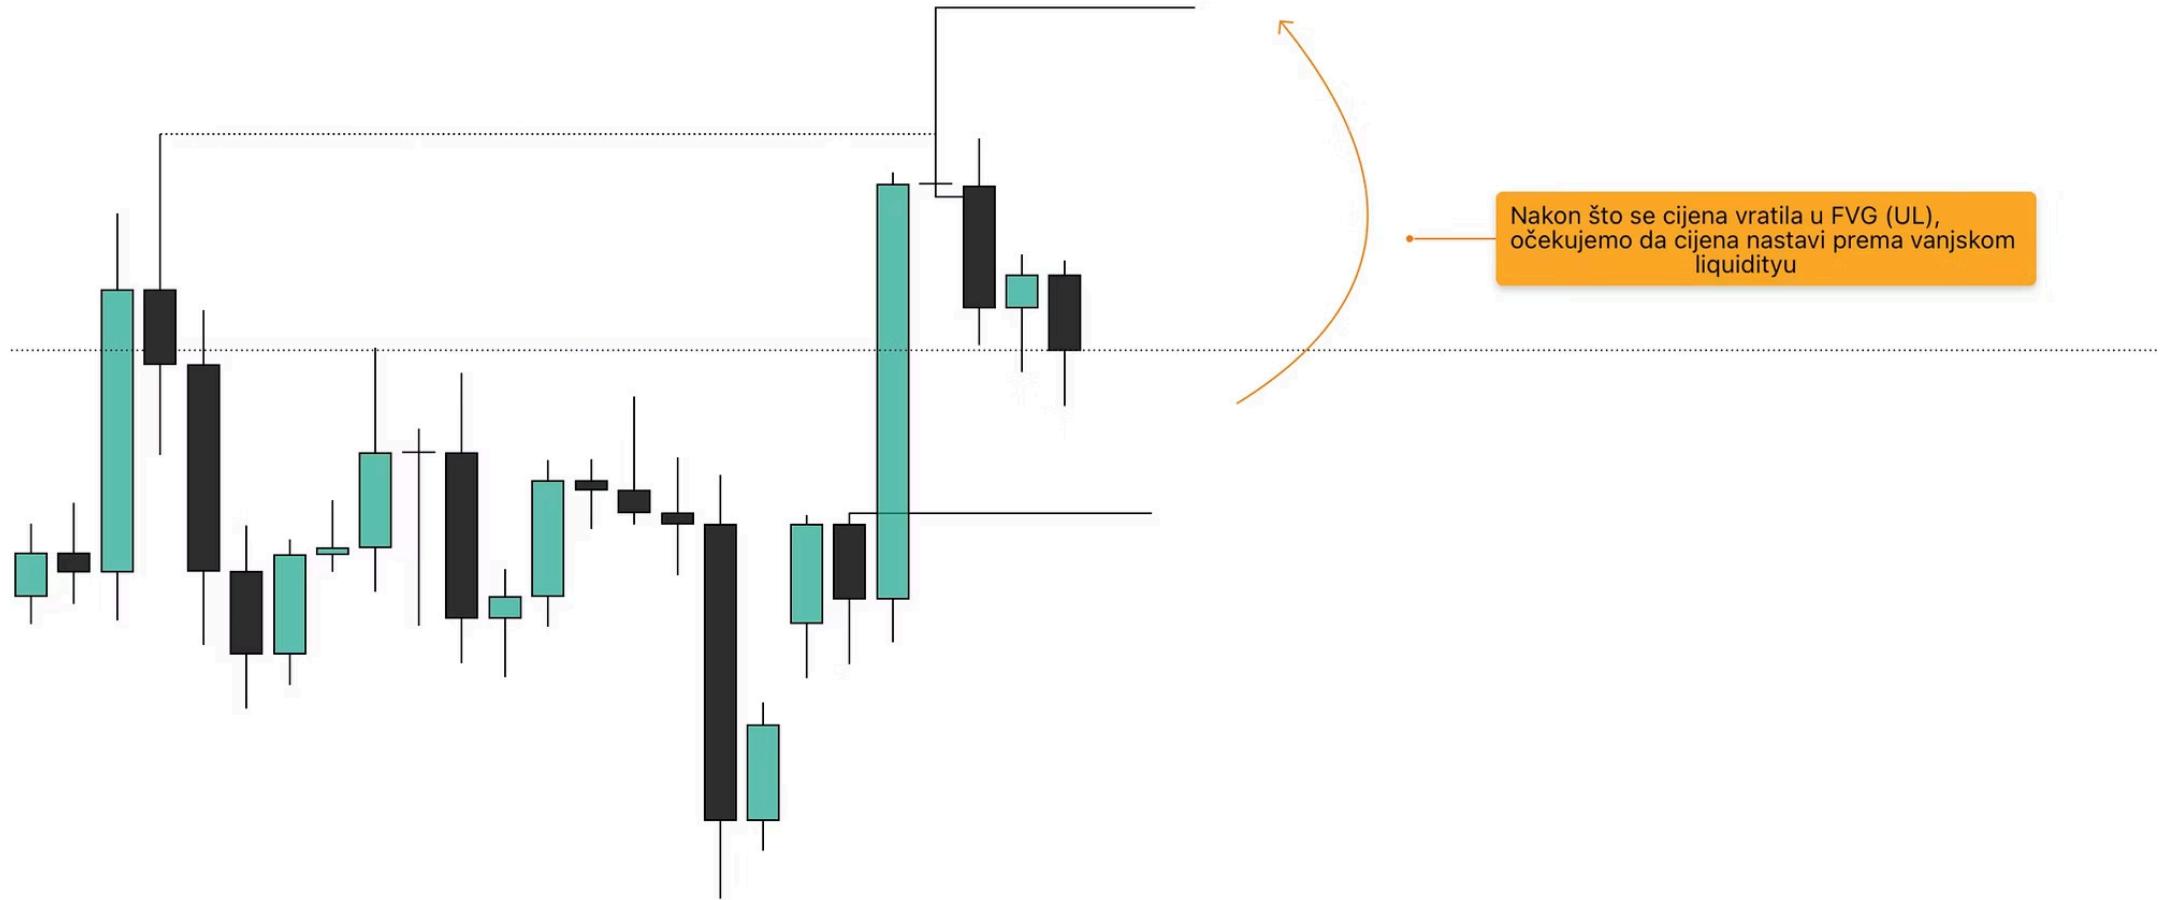

Unutar tog FVG-a nalazi se nekoliko lokalnih swing high/low točaka – to je naš **Unutarnji Liquidity**. Cijena se prvo kreće prema tim unutarnjim zonama kako bi pokupila stopove manjih igrača i očistila likvidnost unutar zone.

Nakon što pokupi unutarnji liquidity (UL), cijena često nastavlja prema **vanjskim liquidityem (VL)** i to može biti, primjerice, swing high iznad FVG-a na višem time frameu.
